

know it means \$11 million a year lost in revenue to the barging industry. When you take this wheat from the barges and put it on a truck, do you know how many trucks it takes to replace those barges per day? It takes 2,000 semi trucks a day. You say you care about the environment? Are you going to burn that kind of fuel, burn up those kinds of miles, cause that kind of congestion in the city of Portland and the city of Seattle? Not on my watch you will not.

What else does tearing out the dams mean? It means a loss of about \$130 million in property values to farmers. What does that mean to property taxes? School support? Roads? All those things are in jeopardy if you take those dams down. Dam breaching takes 37,000 acres of wheat out of production. What happens to those families? Their land goes back to sagebrush.

It takes at least 5,370 direct jobs in Portland. I actually think it is higher than that when you look at the ripple effect. When you take out these dams, you lose longshoremen in Portland and the many other service-related jobs that depend on them. Not only that, but to take these dams out, it would cost \$809 million. Some have said that it could cost that much for each dam—I don't know whether we can get through this body an appropriation to destroy Federal assets that will be in the billions of dollars. What are you going to replace the energy with? What are you going to burn? This is crazy.

What else do you lose? You lose 3,033 megawatts of clean hydroelectric power. That is the amount it takes to run the city of Seattle every day. We are going to take that out in the face of projected energy shortages? Not on my watch.

So I say with the Senator from Washington: No, not on our watch.

I say to my fellow citizens in Oregon, this is the most important question you can ask Al Gore. Governor Bush has answered it. Please, Mr. Vice President, tell us what is your position on tearing out hydroelectric power in the Pacific Northwest? One of your agencies says do it. Another says we don't know enough yet. A third says don't do it. And GORE is refusing to answer the question.

We can have our fish and we can have our power. There are many things we can do, short of destroying our energy infrastructure and our clean, hydroelectric power. There are many things we can do to save fish short of the destruction of this kind of energy. To replace our clean energy with any other type, you are going to burn something and Oregonians will live in a dirtier place. I do not want them to.

I ask the Vice President, respectfully, to answer the question. What is your policy on dam breaching?

EUROPEAN UNION HUSHKIT REGULATION

Mr. INHOFE. Mr. President, the International Civil Aviation Organization, ICAO, is a specialized agency of the U.N. that has been tasked for more than 50 years with the safe and orderly growth of international civil aviation. Based in Montreal, this 185 countries strong organization develops international standards on such critical issues as noise, emissions, and air worthiness.

I am saddened to report that, last week, the European Union dealt a severe blow to the integrity and future viability of this critical organization. I, of course, am speaking of the EU's implementation of the so-called hushkit regulation. This regulation bans hushkitted aircraft from being registered in Europe, prohibits such aircraft that are not European registered from flying in Europe within two years, and bars certain reengined aircraft with low by-pass ratios from European airspace. The regulation was implemented despite the fact that the aircraft in question meet the highest international noise standards.

Thankfully, in March, the U.S. filed an Article 84 case within ICAO against the fifteen EU Member States arguing that the regulation violated the Chicago Convention. ICAO will review the matter this fall, and hopefully resolve it in a way that reaffirms its position as the sole, international standard setting body.

Ironically, the EU wants to have its cake and eat it too. EU Members States are now anxious for ICAO to establish new, more stringent, Stage 4 noise standards. Indeed, the U.S. is working with ICAO on this endeavor as we speak. The key question becomes, why should we develop new standards if the EU has demonstrated that the old ones can be disregarded at whim? If the EU wants Stage 4, it must begin by demonstrating its respect for Stage 3 by withdrawing the hushkit regulation.

Mr. President, I will be following the resolution of this dispute very carefully. It is critical to future trading opportunities that the integrity of the ICAO process be upheld.

SECURITY AND COMMERCIAL SATELLITE IMAGERY

Mr. AKAKA. Mr. President, as Ranking Member of the Subcommittee on International Security, Proliferation, and Federal Services of the Governmental Affairs Committee, I am concerned about an emerging issue that has important implications for our national security: the commercial satellite imaging industry. Soon the public will have access to high resolution pictures able to show objects as small as three feet in size.

The rapid evolution of satellite technology has suddenly made the "eye in

the sky" accessible to everyone, from foreign governments to the average individual. Secret sites are suddenly no longer secret. Photos of Area 51, a top-secret military installation located in Nevada, were recently made available by a private company selling commercial satellite images. The wide availability of these pictures to any person or country that can afford to buy them has the potential to both help or hinder our security.

Initially satellites were used during the Cold War for defense purposes. These classified images were only available to the government. However, civilians began to benefit from satellite pictures about thirty years ago when the government satellite, Landsat, began to sell photos to the public for agricultural planning purposes. The first commercial satellite launch did not occur until 1986, when France, Sweden and Belgium jointly launched SPOT I.

The technology of satellites today has evolved considerably since Landsat, in 1972, began providing photos to the public. Those pictures could only render images of objects larger than 250 feet across.

This all changed when earlier this year a private company called Space Imaging made history by distributing the first high-resolution satellite images of a North Korean ballistic missile site. Their photos had a one-meter resolution, providing the public a detailed look at the missile facilities of this rogue nation. Ruts in the road used by North Korean trucks could be seen.

The industry for commercial satellites is growing steadily. In 1994 President Clinton issued Presidential Decision Directive 23 which permitted the Commerce Department to license 12 U.S. companies to operate remote-sensing satellites. Space Imaging and Aerial Images, the company which took the Area 51 pictures, may be the first two of these companies to get a satellite aloft, but there are more to come. At least two other U.S. companies plan on launching satellites this year and several foreign companies have similar plans.

Legal restrictions surrounding these photo purchases are few. Imaging companies do not have to identify either their customers or their pictures. An amendment to the 1997 Defense Authorization Act prohibits U.S. companies from selling satellite images of Israel that show objects with a diameter under 6 feet. Any sale of images to a terrorist state or any regime under U.S. or international sanctions is also prohibited. Aside from these restrictions, there are virtually no limitations on any satellite or any sale of satellite pictures. And even these restrictions are going to be harder to maintain as competition increases from more companies outside the United States.
